

PU seal is mainly used in oil cylinder, can be easily fixed and scrape the dust and dirt off the piston. (Hardness of green PU is relatively lower, while blue ones is higher and with greater pressure endurance. See<used abroad>)

PU seal has good mechanical, water-proof and oil proof property, most frequently used in hydraulic oil cylinder with medium and high pressure. U-ring is the most frequently used seal in hydraulic cylinder. It's typical lip seal, which is able to gain seal effect no matter in piston or piston rod.
